Communication with HIDDEN & Highly ENCRYPTED

DUAL - STEGANOGRAPHY

Abstract:-

The proposed work explains a high capacity steganography technique using dual steganography approach. It involves a Multi pass encryption system to scramble the mystery message that was intended to hidden, before transmitting the message. The Text that has to be sent was hidden in such a way that even , if the message is restored from the image using the latest available cracking tools in cyber security, the content of the message is not concealed and unwrapped by any unknown intruder without the possession rights. The technique was developed in a way that even the BruteForce effect also won't work on the Encrypted message. All the Updated BruteForce techniques which were available at time of creating this project were eliminated and their risk factor is minimized. Here we are using 2 layers of security for the context to be hidden. One is Encryption of the message. Two is Hiding that Encryption in any format of transformable medium such as pdfs, images, videos, mails etc.. (Image Format is used in my Process).

Till now we have many projects of Dual Steganography. All the methods use, cryptographic encryption, which may be vulnerable to some of high processing cyber attacks. My project is different from those in such way that, I used a type of encryption *(confidential) that usually takes 4 days approximately for a 16 gb ram processor to decrypt without a key.

KEYWORDS :- Steganography,Encryption,Cryptography,Cyber Security,
Brute Force
